

# **MOIRE**

## ***Membrane Optic Image Real-Time Exploitation***

---

***Lt Col Travis Blake, Ph.D.***  
**Program Manager**

**Mirror Technology SBIR/STTR Workshop**  
**21 Jun 2011**

## What makes DARPA unique...

---

**Formed in 1958 to PREVENT and CREATE strategic surprise**

Capabilities, mission focused

Finite duration projects

Diverse performers

Multi-disciplinary approach...from  
basic research to system engineering

As the DoD's innovation engine, we  
are committed to the boldest, creative leaps...

# DARPA TTO

**TTO transforms the future of warfighting by pursuing high-risk, high payoff tactical technology and development of rapid, mobile and responsive combat capability for advanced weapons, platforms and space systems.**

**Creating highly capable systems that enable "order of magnitude" improvement in military capabilities in a rapidly changing technological landscape**

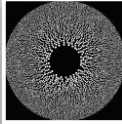

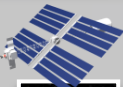

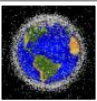

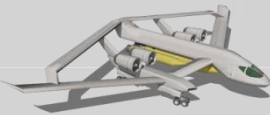

**Investing in research and technologies that enable strategic advantage over technological surprise in TTO focus areas**

**Developing technologies and systems that facilitate "game changing" tactics, techniques and procedures that address the entire spectrum of armed conflict Understanding and addressing critical deficiencies in crucial mission areas**

**Conceptualizing, demonstrating and transitioning advanced technologies and concepts for effective, survivable and cost effective military systems**

*A typical DARPA TTO effort is a 3-5 year program to develop a prototype(s) showing proven technical capability*

# MOIRE

## Program Objectives

- Persistent, tactical, real-time video from geosynchronous orbit
  - 24/7 coverage of denied territory
  - Provide real-time troop movements, targeting & BDA
  - Provide vehicle tracking, missile launch detection

## Performance Metrics

- Membrane optics system with Fresnel pattern to focus an image for 15x resolution improvement over same mass to orbit for a reflective telescope
- 500x reduction in primary optic weight for same resolution
- 10x savings in production costs compared to glass optics for same resolution

## Military Utility

- **Real-time 1 frame/sec video to warfighters**
- One satellite can image 1/3 of earth's surface, without changing orbit, at 1 meter ground sample distance resolution

# Diffractive Optics Enable Cost Effective Tactical GEO Imager

## JWST (next gen. SOA)

- 6m, segmented, glass deployable reflective concept
- \$250M NASA Phase A study
- Typical \$3-4B solution
- S/C Mass – 10,000 kg
- 38 nm design tolerance
- 20+ year development time

## MOIRE

- 20 m membrane
- Proposed \$20M Phase I
- <\$500M operational system
- S/C Mass ~3,000 kg
- 10 um design tolerance
- 5 year development time

# MOIRE Objective System

---

## **Design Reference Mission Performance Goals**

- Persistence – 24/7
- Missile launch detection & vehicle tracking
- VNIIRS – 3.5+
- Ground Sample Distance --  $\sim 1\text{m}$
- Visible/IR Video @  $> 1\text{ Hz}$
- Field of View  $> 100\text{ sq km}$
- Field of Regard – 15,000 km by 15,000 km (without slewing)
- $< \$500\text{M/copy}$  (after R&D)

## **Performers**

- Ball Aerospace and Technologies Company, Broomfield, CO
  - ATK Space Systems, Inc., Goleta, CA
  - Lawrence Livermore National Laboratory, Livermore, CA
  - NeXolve Corporation, Huntsville, AL
- Northrop Grumman Aerospace Systems, El Segundo, CA
  - NeXolve Corporation, Huntsville, AL
  - Astro Aerospace, Carpinteria, CA

**Phase 1 efforts will complete September 2011**

# MOIRE Schedule

## Phase 1 - Optical Component Performance

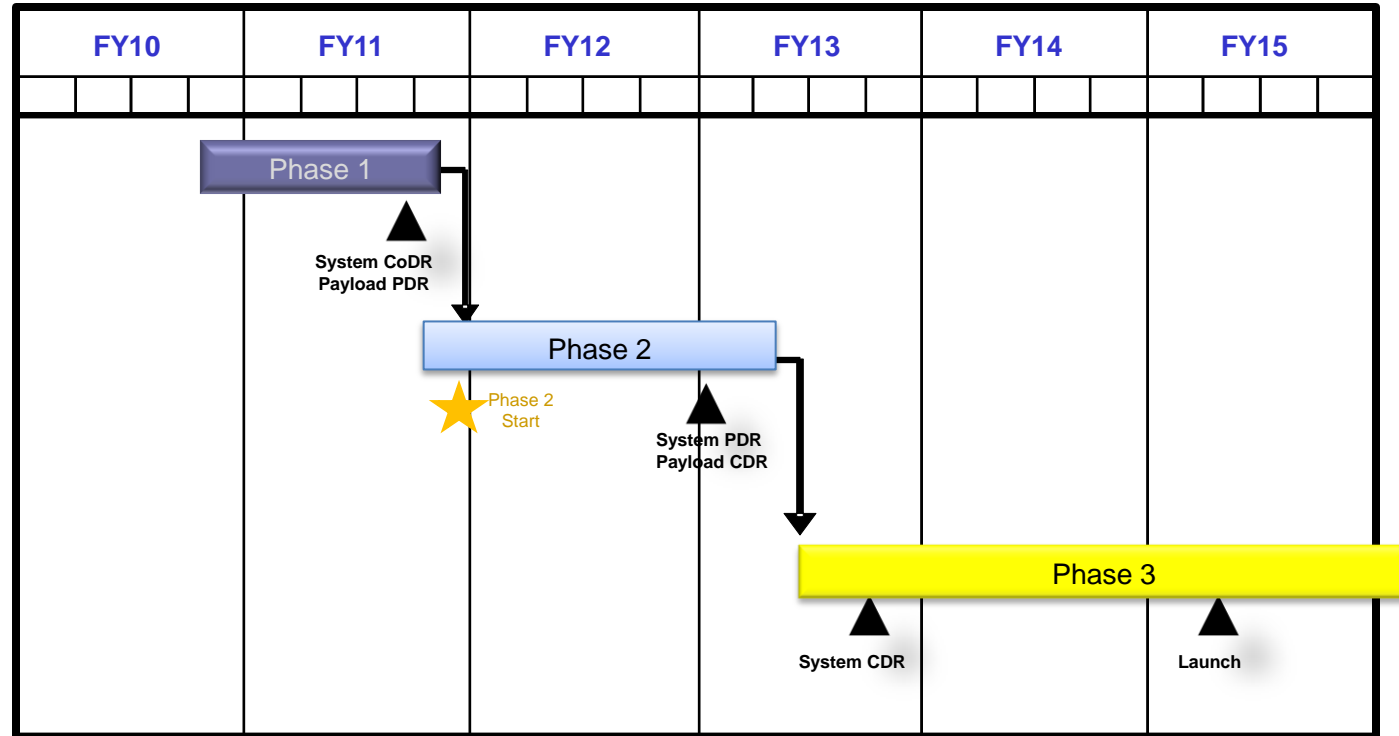

- Validation of optical prescription, design and structure
- Major optical risks retired

## Phase 2 - Optical System Design

- Validation of subsystem elements
- Manufacturing validated
- Structure risks retired
- ETE NIIRS Model

## Phase 3

- 10 m space telescope demo
- Space M&S validated

### Phase 1 - base

- Two awards
- 12 months
- Diffractive membrane lens at 1m tested for optical prescription

### Phase 2 – priced option

- One selected to continue
- 18 months
- Subsystem fabrication, test, and control
- Manufacturing and alignment demo
- Imaging telescope design traceable to GEO concept and NIIRS objective
- Ends in PDR

### Phase 3 –option

- Notionally 36 months
- 10 m prototype demo

# PI & PII Program Metrics

Phase 3 – 10 m Flight Demo, 1000 kg, EELV Medium to GEO, 5 Meter Fairing

Metrics Ensure Traceability to An Operational System Meeting Warfighter Utility Needs and DoD Fiscal Constraint Realities

# Summary

---

**MOIRE seeks to provide tactical video coverage and missile launch and detection**

**Membrane, diffractive optics enable relatively low cost solution for GEO based imager**

**Future system enhancements can provide greater spectral content and improved resolution**

**MOIRE Phase 1 ground demonstrations will focus on payload risk reduction, large scale fabrication, image quality metrics, structural deployment, and image processing**

**MOIRE Phase 1 will culminate with a space system CoDR and payload PDR**

# Link Budget – Efficiency / Narrowband Challenge

Adequate SNR At Existing 0.35% Efficiency, Integration of 0.1 sec

| SNR                | 14 dB          |
|--------------------|----------------|
| Aperture           | 10 m           |
| Detector Pitch     | 8 micron       |
| F#                 | 15             |
| GSD                | 2 m            |
| Efficiency         | 0.35% measured |
| Integration        | 0.5 sec        |
| Wavelength         | 532 nm         |
| Ground Reflectance | 2%             |

- Simulated image assuming parameters above.
- Image is narrowband converted to grayscale.
- Image is estimated to be better than NIIRS 3.5
- Image contains realistic shot and read noise
